

1. The following commands are used to compile and run the Web Proxy Server:

```
$ gcc WebProxy.c  
$ ./a.out {port number}
```

2. The following commands are used send request through any browser client:

```
<ip address>:<port number>/Url  
Eg: 120.129.151.94:3333/www.google.com
```

NOTE:

- i. Replace port number with a value less than 5000.
- ii. Same port number to be used with browser and while running the proxy.
- iii. IP address is that of the machine that runs the Proxy program.
- iv. The following commands are specific to a Linux terminal. The commands will work on UNT CSP machines.
